

The Aperture Method™ — Document Register

Version 1.6 · 10 August 2026 · Owner: Fenwick How

Every artifact in the project, what governs it, and how it is regenerated. This register is written in markdown and rendered to `DOCUMENT REGISTER.pdf` by `Operations/build/build_register.py` — the markdown is the source, the PDF is a dated snapshot, and every page of the PDF foots with the version it came from so a stale copy announces itself. If a document is listed as **generated**, do not edit it by hand — edit its source and re-run the builder, or the next rebuild will silently discard your change. That is exactly how the seven-lens drift happened: three documents were edited separately and nothing compared them.

Where two artifacts disagree, the one named in **Governed by** wins.

1. Sources of truth

These are the files everything else is derived from. Change one of these and expect to re-run several builders.

#	Source	Version	What it governs
S1	Force5 Plugin/templates/rubric.json	1.2.0 · ratified 10 Aug 2026 · plugin 0.3.0	The seven lenses, their weights, sub-criteria, anchors, coverage floor
S2	aperture-website/src/lib/onboarding/intake.ts	112 questions · 5 segments	Every intake question, its field name, and the order they are asked in
S3	aperture-website/src/lib/lenses.ts	mirrors S1	How the seven lenses are described publicly
S4	Operations/build/reference.html	1.3	The architecture — phases, gates, object types, guarantees
S5	Operations/build/template.html	—	The architecture map's content
S6	Operations/Method SOPs/*.docx	—	How each phase is actually run
S7	Demo - Lumina .../03_Playbook/production_scripts/*	—	Every Lumina deliverable
S8	aperture-website/src/lib/pricing.ts	mirrors the SOW schedule	Every fee the website quotes, including the Exhibit A table shown in the onboarding flow
S9	aperture-website/src/lib/rubric.snapshot.json	generated from S1	The copy of the rubric that ships with the website, so the Vercel build can check the published lenses against the instrument. Regenerate with <code>npm run sync-rubric</code> whenever S1 changes.

Ratified decisions

Decision	Ratified	Where it is written
The seven lenses and their weights — Finance 20 · Operations 18 · Customers & Retention 18 · Market & Competition 14 · Leadership & Team 12 · Processes 10 · Technology & Data 8	10 Aug 2026	S1; Reference §2.2
Aperture Atlas™ is the single name for component 05, internal <i>and</i> client-facing. "Aperture Live" is retired.	10 Aug 2026	Reference §2.1.1
Five phases, with the Business X-Ray as the fixed-fee entry diagnostic. Six SOPs.	10 Aug 2026	Reference §2.1.2
The people boundary. The Method assesses the system that holds capability — dependency, cover, documentation, structure, qualified capacity — never individuals. No HR, employment-law, pay-benchmarking or hire/fire advice. Every people finding must pass the read-aloud test.	10 Aug 2026	Reference §2.3; contract §1; SOW §7
Pricing — the SOW schedule. X-Ray \$9,500 fixed (credited toward the Full Method within 60 days) · Full Method \$41,000 (\$34,500 after that credit) · Aperture Atlas \$2,950/month, 6-month minimum.	10 Aug 2026	Contract Exhibit A; Reference §13 D1

2. Automatic checks

Five checks run without being asked. They exist because every one of them corresponds to a failure that already happened once.

Check	Runs when	Fails if
<code>aperture-website/scripts/check-lenses.mjs</code>	every site build (prebuild) — on Vercel too , via S9	The site's lens names, order or weights differ from S1 · the weights do not total 1.0 · the rubric is not ratified · the intake form's lens headings disagree · a retired lens name appears in <code>src</code> · the retired product name "Aperture Live" appears in <code>src</code>
Force5 Plugin/tools/ <code>validate_rubric.py</code>	test suite	Any <code>intake_refs</code> entry stops resolving against S2, or reverts to a positional reference
<code>aperture-website/scripts/check-lenses.mjs</code> (fee check)	every site build	Any fee is hard-coded outside S8. Files whose money is illustrative demo data declare themselves with <code>@illustrative-figures</code> .
<code>check-lenses.mjs</code> (snapshot freshness)	every build on a machine that has the plugin	S9 disagrees with S1 — i.e. the rubric changed and nobody re-ran <code>npm run sync-rubric</code>
Force5 Plugin/tools/ <code>tests/</code> (28 tests + 1 that needs the website alongside)	<code>pytest</code> — not installed on your machine , so nothing runs these automatically. <code>pip install pytest</code> , then <code>python3 -m pytest tools/tests</code> from the plugin root.	A figure is built without citations · prose arithmetic is passed off as a computed figure · an unrated rubric produces a score · insufficient evidence is scored as zero · weight is redistributed away from an insufficient lens

3. Generated documents

Document	Built from	Command
Operations/ Aperture Method - Seven-Lens Rubric.pdf	S1	python3 tools/render_rubric_pdf.py templates/ rubric.json <out>
Force5 Plugin/ templates/rubric.md	S1	python3 tools/render_rubric.py templates/ rubric.json > templates/rubric.md
Operations/ The Aperture Method - Intake Questionnaire.pdf	S2	python3 tools/ render_intake_pdf.py <intake.ts> <out>
Aperture Method - Canonical Architecture Reference.html / .pdf	S4	python3 Operations/build/build_reference.py
Aperture Method - Master Process Architecture.html / .pdf	S5	python3 Operations/build/build_map.py then build_pdf.py
Lumina deliverables 0 – 5	S7	node <script>.js
Lumina – Aperture Method Engagement.docx (bound volume)	S7	python3 build_bundle.py — two passes, so the contents table carries real page numbers
Lumina – Aperture Method Results.pdf	the bound volume	export to PDF
aperture-website/ public/reports/ Lumina-Aperture-Meth od-Example-Report.pd f	the bound volume	copy of the above
Demo .../ 05_Dashboard/ Aperture Atlas Scoreboard.html	build_dashboard.py	python3 build_dashboard.py
Operations/ DOCUMENT REGISTER.pdf	this file	python3 Operations/build/build_register.py

What each builder needs, and what your machine has

Checked on this machine, 10 Aug 2026. **Two builders cannot run here as things stand.**

Builder	Needs	Status
build_register.py	reportlab	■ runs
render_rubric_pdf.py , render_intake_pdf.py, render_rubric.py	reportlab	■ runs
build_dashboard.py	pandas	■ runs
Lumina deliverables, build_bundle.py	node + docx, LibreOffice	■ runs
build_reference.py, build_pdf.py	playwright + Chromium	■ not installed

The reference and the architecture map are the two documents you cannot currently rebuild. To fix, once:

```
`` pip3 install playwright && python3 -m playwright install chromium ``
```

Until then, those two PDFs can only be regenerated in a session where playwright is present — which means the HTML and the PDF can drift apart without anything noticing.

Copies that must move together. The Method Lab serves its own copies of four documents. When you rebuild any of them, replace both:

Master	Method Lab copy
Aperture Method - Master Process Architecture.html	aperture-website/private/method-lab/architecture.html
Operations/ Aperture Method - Canonical Architecture Reference.html	aperture-website/private/method-lab/reference.html
both PDFs	aperture-website/private/method-lab/downloads/
Agent Build Plan/ 01 ...Build Spec.docx / .pdf	Agent Build Plan/downloads/ and method-lab/downloads/

4. Hand-authored documents

Edit these directly. Nothing regenerates them, so nothing will overwrite your changes — and nothing will catch a contradiction either.

Document	Version	Notes
Operations/ Method SOPs/01-06	—	How each phase is run. SOP 01 defers to the rubric rather than restating the lenses, which is why it never drifted.
Operations/ 00 – Operations Playbook (Overview).docx	—	

Document	Version	Notes
Operations/ Client Onboarding/ New Customer Contract Agreement.docx	—	Exhibit A now carries the published schedule (§5). Exhibit B is still blank — no record of the systems and data access granted.
Agent Build Plan/ 01 – Agent Build Spec.docx	—	Historical planning document. §9's weight table is superseded and marked as such; score from S1, never from this.
Agent Build Plan/ 02 – Agent Workflow Map.docx	—	
Force5 Plugin/ skills/**/SKILL.md, agents/*.md	—	The agent constitution and per-phase procedure.
README.md, STATUS.md, this register	—	

5. Pricing

Settled 10 August 2026: **the SOW schedule governs**. The contract's Exhibit A was rewritten to match and its "from" floors removed, so there is now one published price list.

	Fee	Note
Business X-Ray™	\$9,500 fixed	Credited toward the Full Method if the client proceeds within 60 days
Aperture Insights / Analytics / Intelligence / Compass	quoted per engagement	The SOW never listed individual phase fees, so none were invented. Set the figure in Exhibit A's "Agreed fee" column.
Full Method (bundle)	\$41,000	\$34,500 after the X-Ray credit
Aperture Atlas™	\$2,950 / month	6-month minimum, 30 days' notice thereafter

The website derives every fee it shows from **S8**, including the Exhibit A table rendered in the onboarding flow — so the number a prospect reads on the homepage and the number in the contract they sign cannot diverge. Before this, the homepage said "from \$2,500" while the signing flow said "from \$25,000", and `HowItWorks.tsx` carried a comment reading *"PRICES are placeholders — swap for Fenwick's real numbers"* that had outlived the real numbers.

The one number still to set: individual phase list prices. Four phases sum to \$34,500 in the bundle, which implies roughly \$8,625 each — but that would mean no bundle discount, which is a pricing decision rather than an arithmetic one. Until you set them, Exhibit A quotes them per engagement.

6. Knowing what is deployed

The site reports its own build. Two places, same source:

Where	Shows
Footer, every page	build a1b2c3d · 2026-08-10 18:47Z — the commit and when it was built. Links to /version.
/version (JSON)	Commit, branch, commit message, build time, Vercel environment, plus the rubric version, the ratified flag, the lens signature , all seven weights, and the published fees — as compiled.

scripts/stamp-build.mjs writes these at build time from VERCEL_GIT_COMMIT_SHA (or local git as a fallback), so the values cannot be anything other than what shipped.

To check you are synced: open /version. If commit matches your last push and rubric.version / lensSignature match rubric.json, the deployed site is the thing you pushed and it was built against the ratified instrument. A local build from an uncommitted tree reports builtFromDirtyTree: true and the footer reads +dirty.

The current lens signature is 801cb290 for rubric 1.1.0. It changes if any lens id or weight changes, so it is the fastest way to spot an instrument change at a glance.

7. Still open

Every remaining item is something *missing* to build, not a contradiction to settle. Carried from the Reference's decision register (§13) and the map's gap register:

- **~20 named tools are unbuilt.** Only the scoring engine exists. Every other number in a deliverable is produced by hand, so the Method is not yet repeatable without you doing it.
- **No ledger or provenance store** outside the scoring engine — nothing enforces "every figure traces to source" for the rest of the work.
- **The hosted Scoreboard** is sold as live and delivered as a monthly CSV drop plus an HTML mock-up.
- **The Signal Brief and anomaly detection** are priced and specified but absent from SOP 06.
- **The Business X-Ray has no segment in the intake form** — the most common single purchase has no intake path.
- **Exhibits A and B of the contract are blank.** No fee schedule, no record of system access granted. No NDA artifact exists, though three documents reference one.
- **Only aperture-website is a git repository.** The plugin, Operations, the Demo package, the architecture map and this register are **not under version control** — no history, no remote, no recovery if the folder is lost. This is the largest single risk in the project.
- **next@14.2.15 carries a published security advisory.** Worth an upgrade on its own schedule; the build warns about it on every install.
- **SOPs 03, 04 and 05 contain no human steps** despite the Build Spec assigning you approval duties in each.

Amendment record

Version	Date	Change
1.6	10 Aug 2026	The human factor, deliberately bounded. Rubric to v1.2.0 — ldr-04 succession and capability transfer, ldr-05 structure and span, ops-05 qualified capacity, and ldr-01 now scores 80 only where key-person exposure is priced. Four intake questions added (112 total). Reference §2.3 defines what is assessed and what is declined; the exclusion is in the contract and the SOW. Plugin 0.3.0.
1.5	10 Aug 2026	Adds the build stamp and <code>/version</code> . Records that only aperture-website is under version control, and closes a hole this exposed: the lens check was running in degraded mode on Vercel because the rubric is not in that repo — it warned and passed. S9 (the committed rubric snapshot) fixes it.
1.4	10 Aug 2026	Adds <code>build_register.py</code> so this register has a PDF that regenerates from the markdown rather than drifting from it, and records which builders can actually run on Fenwick's machine — the reference and map builders need playwright, which is not installed.
1.3	10 Aug 2026	Post-push verification. Corrects the Lumina README (the bound volume is 54 pages, not 52, and had no PDF outline), fixes a quoting bug in <code>readme_doc.js</code> , bumps the plugin to 0.2.0 with the rubric version stamped in its manifest, and records that the plugin test suite has no local runner.
1.2	10 Aug 2026	Adds S8 (<code>pricing.ts</code>) and the fee check after finding the public homepage and the onboarding contract flow still quoting the superseded schedule.
1.1	10 Aug 2026	Records the pricing decision: the SOW schedule governs and Exhibit A was rewritten to match. Closes the last contradiction in the register.
1.0	10 Aug 2026	First register. Created after a project-wide reconciliation that ratified the seven lenses across every artifact, made Aperture Atlas™ the single name for component 05, rebuilt the Lumina package and the public example report, and put the three automatic checks in place.
